

We've been making stuff since the stone age

However, our tools have changed dramatically.

Conceptualize

From cave walls, stone tablets, and paper to computers to word processors and note taking apps.

Design

From pencil and paper to computer aided design (CAD).

Build

From stones and hammers to power tools, CNC machines, 3d printers, and robotics.

So, what's the problem?

Designing and building has become a very complex process.

Design is difficult to get right. It takes years of education and practice to become proficient enough to create functional and beautiful things.

Building them is even more difficult. You need expensive tools, safety equipment, and space—not to mention years spent learning your craft.
