

How do we do that?

Through a simple and opinionated framework for making things, of course.

EndoSketch is a simple **online design tool and manufacturing service** where people can quickly make things like furniture, storage, stands, fences, lighting, toys, puzzles, moulds, and sculptures—all via a highly constrained and novel structural framework that combines wooden rods and 3d printed connectors.

Huh?

It's basically the
Betty Crocker of
making stuff.
